## Getting Started

---

### System requirements

We require:

1. UHDS interface
2. KA0004 activation

### Getting help

All operation can be done by OBD or by Dash Connector.

Write Operation can take about 40 min

This process is divided for 3 steps :

- Read Flash (backup of flash will be done automatically and saved in folder my documents)
- Write Flash
- Write Flash (second time).

After first write please careful look on messages. Soft ask you switch ignition on/off etc... If you can will be fine drive few km without disconnect UHDS. After that press ok and software will reflash dashboard again .

if from any reason flash precess will be interrupted and fail you always can restore it by write flash file from backup.

If you interrupt process after first write flash (second write flash is not done) dashboard will not count km and all the time will show same value. In this case you have to write original flash.
